

Website Code Separation Assignment

Use the supplied **index.html** file. It is a complete, working travel website with a navigation bar, photo slideshow, video section, and footer.

Your Goal

Turn the one-file website into a well-organised project. Do not change the design, alignment, slideshow behaviour, navigation bar, footer, or main text. Your work is to move the code into the correct external files and replace the sample media with your own.

1. Create the Project Folders

Create a folder called **travel-website**. Put the supplied **index.html** file inside it. Then create these folders:

```
travel-website/  
■■■ index.html  
■■■ css/  
■ ■■■ style.css  
■■■ js/  
■ ■■■ script.js  
■■■ images/  
■■■ videos/
```

2. Move the CSS

- Open **index.html**. Find everything between **<style>** and **</style>**.
- Cut that CSS code and paste it into a new file named **css/style.css**.
- Remove the full **<style>...</style>** block from **index.html**.
- Inside the **<head>** section, add this line:

```
<link rel="stylesheet" href="css/style.css">
```

3. Move the JavaScript

- Find the JavaScript between the final **<script>** and **</script>** tags.
- Cut it and paste it into a new file named **js/script.js**.
- Remove the full JavaScript block from **index.html**.
- Just before **</body>**, add this line:

```
<script src="js/script.js"></script>
```

4. Use Your Own Images and Video

- Choose three images and place them in the **images** folder.
- Choose one MP4 video and place it in the **videos** folder.
- Change only the image and video file paths in your code. Example:

```
  
<source src="videos/myvideo.mp4" type="video/mp4">
```

Do not use links from the internet for your final submission. Your images and video must be inside your project folders.

5. Check Your Work

- Open index.html in a browser. The navigation links, slideshow buttons, automatic slideshow, and video controls must work.
- Check that your page still looks neat and aligned after separating the code.
- Reduce the browser width to check that the website works on a smaller screen.
- Make sure no Bootstrap, Font Awesome, or external CSS/JavaScript library is used.

6. Submission

Push your completed project to your GitHub repository. Add me as a collaborator, then share your repository with me through Google Classroom.
